

IPA DEBATE CLUB QUESTION 2 (IPADCQ-2)

1. Share your experience towards Horizontal Geyser Performance and function in high rise residential buildings over 15 stories.
2. **What is the most acceptable discharge of cooling tower blow down into storm water drain or in-house STP. Are there guidelines available on these from PCB or MoEF?**

Please send in your replies (along with full name, designation, IPA Membership No. and contact details) latest by 15 May 2019 to:

IPA Technical Committee Convenor's Note:

Questions of importance to plumbing professionals would be published periodically in IPT with a view to get opinions/clarifications. The first question was published in January 2019,

IPA Debate Club was an established column earlier but was discontinued for some time.

Through the Debate Club, IPT wants to involve all for the benefit of the plumbing fraternity.

Answers, duly vetted by IPA Technical Committee, would be published in IPT. The decision of the IPA TC would not be subject to any challenge or counter claim.

Name of the responding person, whose answer is close to the correct answer, would also be printed in IPT.
